* PP3 Measurements With Old Cone - used KPP9 for flow measurements: ceramic tube touching cone, exhaust ON, (+) flow in direction of exhaust flow - script run for old can proves that there is a leak in the system. Data for this can be found at directory below [redacted] - ALL thermocouple measurements with old cone were done witih the tip of the thermocouple on the surface of the orifice ~ originally we were supposed to take measurements 5mm from the orifice nose but due to leaks in the system we weren't getting any outflow and thus just read room temperature with that set up.

Tried to fit a curve with 'curve_fit' from scipy. - resulting slope yielded not accurate enough so I left out. - below is the code #200 data fit curve df200 = df[df['DesolvationHeater Temp. (degC)'] == 200] xdata = (df200['DesolvationPressure (psi)']) ydata = (df200['ThermoCouple Temp. (degC)']) popt,pcov = curve_fit(func, xdata, ydata) plt.plot(xdata, func(xdata, *popt), color = 'blue')

```

* PP3 measurements with new cone - 'Test cone flow script' data yields that system is now mostly leak free (for some set desol. pressure between 0-60 we will get a positive flow) and we can continue with the rest of our measurements
